

Which discovery will the 2026 Nobel Prize in Physiology or Medicine be awarded for?

Generated 2026년 10월 2일 오전 9:31

Forecast distribution

Full option labels

1. Other
2. for the development of optogenetics, a method to control the activity of genetically defined neurons with light — Karl Deisseroth, Peter Hegemann, Gero Miesenböck
3. for their discoveries concerning the Wnt signaling pathway and its application in cultivating organoids — Hans Clevers, Roel Nusse
4. for the discovery of inherited susceptibility genes for breast and ovarian cancer — Mary-Claire King, Mark H. Skolnick, Michael R. Stratton
5. for the discovery of leptin and the hormonal regulation of body weight — Jeffrey M. Friedman, Stephen O'Rahilly
6. for the discovery of PCSK9 and its role in regulating LDL cholesterol metabolism — Helen H. Hobbs, Nabil G. Seidah, Jonathan C. Cohen

7. for the development of chimeric antigen receptor T-cell therapy — Carl H. June, Michel Sadelain, Steven A. Rosenberg
8. for their discovery of orexin and its role in the regulation of sleep and wakefulness — Emmanuel Mignot, Masashi Yanagisawa, Luis de Lecea
9. for the discovery of chaperone-mediated protein folding in cells — Arthur L. Horwich, Franz-Ulrich Hartl
10. for the discovery of tumour necrosis factor as a therapeutic target in chronic inflammatory autoimmune disease — Marc Feldmann, Ravinder N. Maini
11. for the discovery of glucagon-like peptide-1 and its development into therapies for diabetes and obesity — Svetlana Mojsov, Jens Juul Holst, Lotte Bjerre Knudsen
12. for their development of high-throughput next-generation DNA sequencing methods — David Klenerman, Shankar Balasubramanian
13. for their discovery of the unfolded protein response — Kazutoshi Mori, Peter Walter

TL;DR

Other ranks first at 40.0% (forecast calculation). Optogenetics and Wnt signaling/organoids lead the named discoveries, each at 8% (forecast calculation). The named discoveries together carry 60.0% probability, and a different laureate lineup does not invalidate a matching discovery (calculation and resolution rules).

Context

This forecast uses information available on October 2, 2026, at 14:17 UTC. The Medicine announcement remains ahead: it is scheduled for October 5, 2026, at 11:30 CEST at the earliest, equivalent to 09:30 UTC (forecast cutoff; official schedule).

The target is the discovery in the official motivation, not the exact people receiving the prize. I apply the larger-share rule, then the first-mentioned rule for equal shares, and make the supplied profiles the main evidence for comparing named discoveries (client premises and resolution rules).

Evidence

The historical backbone is the supplied comparison with 60 Medicine laureates from 2000–2025, measured before their awards. The primary dataset contains 30 researchers. Its vintages are OpenAlex January 2026 and PatentsView December 31, 2025, with the supplied patent-to-paper links; individual publication windows collectively span 1889–2021. The discovery-specific component uses 57 unique relevant works published during 1986–2020. Individual coverage windows and work sample sizes are retained in the profile data and calculation. I accept these

premises without a vintage or attribution penalty. Cohort percentiles and foundation shares are fractions; inventions, patents and books are counts (supplied definitions).

The unlisted pool has substantial depth. Optical coherence tomography received the 2023 clinical Lasker, and integrin biology received the 2022 basic Lasker (OCT; integrins). Clarivate's September 17, 2026 Medicine selections included both these unlisted families alongside GLP-1 (official release). Other credible omissions include cGAS DNA sensing, TOR nutrient sensing and low-complexity protein domains, each with discovery-specific Lasker recognition (cGAS; TOR; low-complexity domains). The April 18, 2026 Breakthrough awards add distinct gene-replacement and fetal-hemoglobin-regulation routes (official announcement). I assign Other 40.0% as a coverage judgment, not an observed shortlist-miss rate (calculation).

For named discoveries, the balanced career score gives impact, translation, textbook reach and collaboration weights of 40%, 30%, 25% and 5%. It combines the strongest person's score with the group mean in a 65:35 ratio. Career evidence receives 80% of the combined score; matching defining works receive 20%, emphasizing foundation share over disruption. Shared papers are counted once. Relative weights are proportional to the exponential of five times the combined score (full formulas and inputs).

Rather than commit to one set of coefficients, I average 81 specifications varying career weights, strongest-person aggregation, defining-work weight and exponential scale. The balanced perspective receives most of the ensemble weight. A 10% uniform component accounts for committee priorities absent from the profiles. This produces the following profile-led allocation after the limited secondary adjustments described below (model and normalization):

Discovery	Forecast	Main profile evidence
Optogenetics	8%	Deisseroth has 37% of works in the cohort top 1%, 103 patents and 3,009 citing books. Hegemann's channelrhodopsin paper adds disruption 0.93 and foundation share 0.74. Profiles
Wnt/organoids	8%	Clevers and Nusse form the strongest career-profile group. Clevers has 2,724 citing inventions and 4,442 citing books; Nusse adds a 23% top-1% work share. Profiles
Inherited breast/ovarian susceptibility	6%	King's linkage paper has disruption 0.87; Skolnick's BRCA1 paper has 218 citing inventions. Stratton adds a 36% top-1% share and 5,950 citing books. Profiles

Discovery	Forecast	Main profile evidence
Leptin	6%	Friedman's obese-gene paper combines disruption 0.97 with foundation share 0.91. O'Rahilly adds human leptin-deficiency evidence and 2,961 citing books. Profiles
PCSK9	6%	Hobbs and Cohen have top-1% work shares of 32% and 27%. Their matching PCSK9 paper connects the discovery to coronary protection; Seidah supplies complementary discovery evidence. Profiles
CAR-T	5%	Translation is exceptional: Rosenberg has 10,322 citing inventions, June 5,863 and Sadelain 3,613. June's tisagenlecleucel paper has disruption 0.98 and foundation share 0.79. Profiles
Orexin	5%	De Lecea's discovery paper has disruption 0.94 and foundation share 0.86; Yanagisawa has 3,041 citing books. Lower broad impact comparisons restrain the group score. Profiles
Chaperone folding	4%	Hartl has a 26% top-1% work share and 1,909 citing books. Horwich adds matching mechanistic and structural evidence. Profiles
TNF targeting	4%	Feldmann and Maini have 4,888 and 2,155 citing inventions. Translation outweighs their less exceptional impact comparisons. Profiles
GLP-1	3%	Holst has 2,438 citing inventions and 3,416 citing books. The group's impact benchmark positions and Mojsos's and Knudsen's book-reach comparisons sit below the leaders. Profiles
Next-generation sequencing	3%	The shared sequencing paper has 1,532 citing inventions. Both career translation profiles are strong, but their impact comparisons are lower. Profiles
Unfolded protein response	2%	Mori supplies foundational stress-response papers; Walter has 868 citing inventions and 1,378 citing books. Their combined comparative profile is weaker than most of this slate. Profiles
Other	40.0%	The unlisted discovery pool is broad and contains several independently recognized alternatives. Coverage judgment

The strongest fresh secondary signal belongs to orexin. Its Lasker recognition was announced on September 9, 2026, after the FDA approved oreporexton on August 5, 2026, as a treatment restoring orexin signaling in adult narcolepsy type 1 (Lasker announcement; FDA announcement). GLP-1 has matching recognition from the 2024 clinical Lasker and the September 17, 2026 Clarivate announcement (Lasker; Clarivate). I increase each discovery's relative profile weight by 35%, then renormalize. Sequencing receives a small 10% category discount because the earlier sequencing Nobel went to Chemistry in 1980; this is a Medicine-fit judgment, not an eligibility exclusion (historical award; adjustment calculation). All other secondary multipliers are neutral (adjustments).

What's non-obvious

An outstanding career is not the same thing as outstanding evidence for the resolving discovery. Stratton's BRAF paper does not directly support BRCA susceptibility, Seidah's coronavirus papers do not establish PCSK9, and Rosenberg's broader immunotherapy record is not itself a CAR-T defining paper. Their career profiles still contribute, but the discovery-specific component excludes unrelated work. This prevents a spectacular result in a neighboring field from driving the wrong option (selected works and scoring rules).

Recent recognition establishes scientific standing, not the committee's choice this year. Clarivate explicitly says its program does not predict recipients in a particular year (program disclaimer). Nor can this slate's coverage be estimated by counting how many already-awarded historical discoveries it omits: that comparison selects against a list of discoveries still awaiting recognition. I use concrete unlisted alternatives to set Other, and keep recent awards secondary when ranking the named options (coverage reasoning).

Uncertainties

The largest gap is the committee's undisclosed shortlist and priorities. Nobel nomination information remains confidential for 50 years, so these are not probabilities derived from verified current nominees (official archive rules). Comparable profiles for the strongest omitted discoveries would sharpen the residual allocation. Official wording also matters: a broad stem-cell award does not automatically match Wnt/organoids, and protein-stress signaling must not be collapsed into chaperone-assisted folding (resolution boundaries).

At a fixed 40.0% for Other, the scoring variants put both optogenetics and Wnt/organoids between 6% and 11%. I regard 30%–50.0% as a reasonable sensitivity range for Other; that rescales the named probabilities. These are judgmental model ranges, not statistical confidence intervals. The decimal precision in the probability object preserves the calculation, not certainty about the committee's decision (sensitivity results).

Question Details

The 2026 Nobel Prize in Physiology or Medicine is scheduled to be announced on Monday 5 October 2026. Each option names a discovery and the people most closely associated with it.

Resolution Criteria

Resolves to the option whose discovery matches the discovery named in the official motivation of the 2026 Nobel Prize in Physiology or Medicine, as published at nobelprize.org. Options are matched by discovery; the people named in an option need not match the laureates exactly. If the prize is divided between two discoveries, only the discovery with the larger share counts; if the shares are equal, the discovery named first in the announcement counts. If no option matches that discovery, the question resolves to Other.
